

# My1Login AD Connector V2.0.1401 Release Notes

## Release Date

24th August 2017

## New Features

### **Support for non-AD Certificate Service Authorities**

The My1Login AD Connector now allows certificates issued by standard authorities to be used on the ADC's service endpoint.

## Changes

### **Domain Users Group**

The Domain Users group is now treated like any other group. If Domain Users is a member of another security group then its members are no longer merged with those of its parent.

### **Management App UI Behaviour**

The UI allowed some options to be changed while the service was running, these were not picked up until the service was restarted. To reinforce this, these options are now only editable when the service is stopped.

## Bug Fixes

### **Memory Management Issue**

A memory management issue was identified and fixed. While this only affected customers who were explicitly synchronising the Domain Users group it is recommended that all customers upgrade to this version.
